

PIERO Hardware Requirements

This document outlines the hardware requirements for running PIERO on Linux systems. Ensure that the designated system meets the recommended specifications described below.

Linux System Requirements

Ross Video recommends the following hardware requirements for running PIERO on a Linux system:

- Ross-built M8 or M9 systems are recommended for Linux (required for live video).
- Support is available to help you build your own box (BYOB) to meet the required specifications.

Important: PIERO 20.0 and later are not supported on CentOS, including older CentOS systems. Systems running CentOS will need to upgrade to the tailored Ubuntu build for PIERO.
