Thank you for choosing Ross

You've made a great choice. We expect you will be very happy with your purchase of Ross Technology. Our mission is to:

1. Provide a Superior Customer Experience
   • offer the best product quality and support
2. Make Cool Practical Technology
   • develop great products that customers love

Ross has become well known for the Ross Video Code of Ethics. It guides our interactions and empowers our employees. I hope you enjoy reading it below.

If anything at all with your Ross experience does not live up to your expectations be sure to reach out to us at solutions@rossvideo.com.

David Ross
CEO, Ross Video
dross@rossvideo.com

Ross Video Code of Ethics

Any company is the sum total of the people that make things happen. At Ross, our employees are a special group. Our employees truly care about doing a great job and delivering a high quality customer experience every day. This code of ethics hangs on the wall of all Ross Video locations to guide our behavior:

1. We will always act in our customers' best interest.
2. We will do our best to understand our customers' requirements.
3. We will not ship crap.
4. We will be great to work with.
5. We will do something extra for our customers, as an apology, when something big goes wrong and it's our fault.
6. We will keep our promises.
7. We will treat the competition with respect.
8. We will cooperate with and help other friendly companies.
9. We will go above and beyond in times of crisis. *If there’s no one to authorize the required action in times of company or customer crisis - do what you know in your heart is right. (You may rent helicopters if necessary.)*
Important Regulatory and Safety Notices to Service Personnel

Before using this product and any associated equipment, refer to the “Important Safety Instructions” listed below to avoid personnel injury and to prevent product damage.

Product may require specific equipment, and/or installation procedures to be carried out to satisfy certain regulatory compliance requirements. Notices have been included in this publication to call attention to these specific requirements.

Symbol Meanings

This symbol on the equipment refers you to important operating and maintenance (servicing) instructions within the Product Manual Documentation. Failure to heed this information may present a major risk of damage to persons or equipment.

Warning — The symbol with the word “Warning” within the equipment manual indicates a potentially hazardous situation, which, if not avoided, could result in death or serious injury.

Caution — The symbol with the word “Caution” within the equipment manual indicates a potentially hazardous situation, which, if not avoided, may result in minor or moderate injury. It may also be used to alert against unsafe practices.

Notice — The symbol with the word “Notice” within the equipment manual indicates a potentially hazardous situation, which, if not avoided, may result in major or minor equipment damage or a situation which could place the equipment in a non-compliant operating state.

ESD Susceptibility — This symbol is used to alert the user that an electrical or electronic device or assembly is susceptible to damage from an ESD event.

Important Safety Instructions

Caution — This product is intended to be a component product of the openGear frame. Refer to the DFR-8300 Series Frame User Manual for important safety instructions regarding the proper installation and safe operation of the frame as well as its component products.

Warning — Certain parts of this equipment namely the power supply area still present a safety hazard, with the power switch in the OFF position. To avoid electrical shock, disconnect all A/C power cords from the chassis’ rear appliance connectors before servicing this area.

Warning — Service barriers within this product are intended to protect the operator and service personnel from hazardous voltages. For continued safety, replace all barriers after any servicing.

This product contains safety critical parts, which if incorrectly replaced may present a risk of fire or electrical shock. Components contained with the product’s power supplies and power supply area, are not intended to be customer serviced and should be returned to the factory for repair. To reduce the risk of fire, replacements fuses must be the same time and rating. Only use attachments/accessories specified by the manufacturer.
EMC Notices

United States of America
FCC Part 15

This equipment has been tested and found to comply with the limits for a class A Digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at their own expense.

**Notice** — Changes or modifications to this equipment not expressly approved by Ross Video Limited could void the user’s authority to operate this equipment.

CANADA

This Class “A” digital apparatus complies with Canadian ICES-003.

Cet appareil numerique de la classe “A” est conforme a la norme NMB-003 du Canada.

EUROPE

This equipment is in compliance with the essential requirements and other relevant provisions of CE Directive 93/68/EEC.

INTERNATIONAL

This equipment has been tested to CISPR 22:1997 along with amendments A1:2000 and A2:2002, and found to comply with the limits for a Class A Digital device.

**Notice** — This is a Class A product. In domestic environments, this product may cause radio interference, in which case the user may have to take adequate measures.

Maintenance/User Serviceable Parts

Routine maintenance to this openGear product is not required. This product contains no user serviceable parts. If the module does not appear to be working properly, please contact Technical Support using the numbers listed under the “Contact Us” section on the last page of this manual. All openGear products are covered by a generous 5-year warranty and will be repaired without charge for materials or labor within this period. See the “Warranty and Repair Policy” section in this manual for details.
Environmental Information

The equipment that you purchased required the extraction and use of natural resources for its production. It may contain hazardous substances that could impact health and the environment.

To avoid the potential release of those substances into the environment and to diminish the need for the extraction of natural resources, Ross Video encourages you to use the appropriate take-back systems. These systems will reuse or recycle most of the materials from your end-of-life equipment in an environmentally friendly and health conscious manner.

The crossed out wheelie bin symbol invites you to use these systems.

If you need more information on the collection, re-use, and recycling systems, please contact your local or regional waste administration.

You can also contact Ross Video for more information on the environmental performance of our products.

Introduction

In This Chapter

This chapter contains the following sections:

- Features
- User Interfaces
- Documentation Terms and Conventions

A Word of Thanks

Congratulations on choosing an openGear MFC-8300 Series Controller Card Dual HD/SD SDI Switch. Thank you for joining the group of worldwide satisfied Ross Video customers!

Should you have a question pertaining to the installation or operation of your card, please contact us at the numbers listed on the back cover of this manual. Our technical support staff is always available for consultation, training, or service.
Features

The MFC-8300 Series Controller Cards are designed for the openGear frames and offer a range of monitoring and control options based on the card model. The following sections outline the features for each available MFC-8300 Series Controller Card offered by Ross Video.

MFC-8320 Series

This section outlines the features for the MFC-8320 series cards.

<table>
<thead>

<td>✓ ✓ ✓</td>
</tr>
</tbody>
</table>

\(^a\) Higher power consumption requires higher fan speed for adequate cooling. The fans always run at maximum speed for 5 seconds after the fan door is closed, then adjust to the appropriate level based on power consumption.

\(^b\) Saves items configured on the Network tab plus the Frame Name.

\(^c\) Not available when the MFC-8320-S is installed in a DFR-8310 series frame.
MFC-8310 Series

This section outlines the features for the MFC-8310 series cards.

</tbody>
</table>

\(^a\) Higher power consumption requires higher fan speed for adequate cooling. The fans always run at maximum speed for 5 seconds after the fan door is closed, then adjust to the appropriate level based on power consumption.

\(^b\) Saves items configured on the Network tab plus the Frame Name.

\(^c\) The MFC-8310 does not have network capabilities.

\(^d\) The MFC-8310 does not have SNMP monitoring capabilities.

\(^e\) The MFC-8310 does not have network capabilities.

\(^f\) The MFC-8310 does not have network capabilities.
User Interfaces

Your MFC-8300 Series Controller Card may include the following interfaces.

DashBoard Control System

The DashBoard Control System enables you to monitor and control openGear frames and cards from a computer. DashBoard communicates with other cards in the openGear frames through the MFC-8300 Series Network Controller cards. The DashBoard software and user manual are available for download from our website.

For More Information on...

- the available menus in DashBoard for your card, refer to the chapter “DashBoard Menus” on page 8-1.

Card-edge Controls

The front-edge of the MFC-8300 Series Controller Card feature LED indicators for the power, ethernet connection, and general communication activity. The MFC-8300 Series Network Controller cards also include DIP switches for specifying the IP address of the frame.

For More Information on...

- the specific front-edge controls for your MFC-8300 Series Controller Card, refer to the applicable chapter in this manual.

SNMP Monitoring and Control

The MFC-8300 Series Network Controller cards can provide optional support for remote monitoring of your openGear frame and using the Simple Network Management Protocol (SNMP). This protocol is compatible with many third-party monitoring and control tools.

For More Information on...

- SNMP monitoring and control, refer to the section “Enabling SNMP Support” on page 2-10.
- SNMP controls for your openGear card, refer to the Management Information Base (MIB) file for your card.
Documentation Terms and Conventions

This section outlines the terms and conventions used throughout this manual.

Terms

The following terms are used:

- “Board”, and “Card” refer to openGear terminal devices within openGear frames, including all components and switches.
- “DashBoard” refers to the DashBoard Control System.
- “DFR-8300 series frame” refers to all versions of the DFR-8310 series and DFR-8321 series frames and any available options unless otherwise noted.
- “DFR-8310 series frames” refers to all versions of the DFR-8310 frame unless otherwise noted.
- “DFR-8321 series frames” refers to all versions of the DFR-8321 series frames unless otherwise noted.
- “MFC-8300 Series Controller Card” refers to the MFC-8310 series, and the MFC-8320 series unless otherwise noted.
- “MFC-8310 Series” refers to the MFC-8310-N, and the MFC-8310-NS unless otherwise noted.
- “MFC-8320 Series” refers to the MFC-8320-S, the MFC-8320-N, and the MFC-8320-NS unless otherwise noted.
- “MFC-8310-N” refers to the MFC-8310-N and MFC-8310-NS unless otherwise noted.
- “MFC-8320-N” refers to the MFC-8320-N and MFC-8320-NS unless otherwise noted.
- “OG3-FR series frames” refers to all versions of the OG3-FR series frames unless otherwise noted.
- “Operator” and “User” refer to the person who uses the MFC-8300 Series Controller Card.
- “System” and “Video system” refer to the mix of interconnected production and terminal equipment in your environment.

Conventions

The following conventions are used:

- “Operating Tips” and “Note” boxes are used throughout this manual to provide additional user information.
Installation

In This Chapter

This chapter provides instructions for installing the MFC-8300 Series Controller Card, configuring the network settings, and enabling the SNMP monitoring option.

The following topics are discussed:

• Before You Begin
• Installing an MFC-8300 Series Controller Card
• Network Configuration
• Using a Master Password
• Enabling SNMP Support
• Software Upgrades
Before You Begin

Before you begin, ensure to read the following sections.

Static Discharge

Throughout this chapter, please heed the following cautionary note:

**ESD Susceptibility** — Static discharge can cause serious damage to sensitive semiconductor devices. Avoid handling circuit boards in high static environments such as carpeted areas and when synthetic fiber clothing is worn. Always exercise proper grounding precautions when working on circuit boards and related equipment.

Unpacking

Unpack each MFC-8300 Series Controller Card you received from the shipping container. If any items are missing or damaged, contact your sales representative or Ross Video directly.

Related Publications

It is recommended to consult the following Ross Video documentation before installing and configuring your MFC-8300 Series Controller Card:

- *DashBoard User Manual*, Ross Part Number: 8351DR-004
- *DFR-8300 Series User Manual*, Ross Part Number: 8300DR-005
Installing an MFC-8300 Series Controller Card

This section outlines how to install an MFC-8300 Controller Card in an openGear frame. The same procedure applies regardless of the frame or card type. The MFC-8300 series controller card installs in the last slot on the right side of the openGear frame (when facing the frame).

To install an MFC-8300 Series Controller Card

1. Power off the openGear frame.
2. Open the frame door.
3. If necessary, remove any cards from the frame that would interfere with easy access and lines of sight.
4. Unscrew the Card Retaining Screw (Part No. 850-040R) enough to eliminate any protrusion into the card guide slot on the right of the screw.
5. Insert the MFC-8300 Controller Card, with the component side out into the card guides between the dividing wall and the last slot, ensuring the card does not touch the Card Retaining Screw.
6. Slide the card in the slot until firmly seated and such that the Card Retaining Screw hole on the bottom front edge aligns with the mounted nut beside the bottom guide slot. (Figure 2.1)
7. Tighten the Card Retaining Screw through the Retaining Screw hole, to ensure the card does not move from the slot.
8. Power up the frame.
9. Close the frame door.
10. Check the operation of the fans. If the fans do not operate, verify that:
    • the MFC-8300 Controller Card is seated properly in the frame backplane.
    • the MFC-8300 Controller Card is aligned to the Fan PCB when the door is closed.

Figure 2.1 MFC-8310 Controller Card and Unscrewed Retaining Screw
Network Configuration

The MFC-8300 Series Network Controller Cards feature an ethernet interface which allows cards in the openGear frame to be monitored and controlled using the DashBoard Control System. Communication is possible only when the MFC-8300 Series Network Controller card is suitably configured to match the network to which it is connected.

This section explains the necessary parameters and lists several possible methods for managing these parameters.

• **Automatic configuration using DHCP** — When shipped from the factory, the Network Controller card is configured to automatically obtain network settings from a Dynamic Host Configuration Protocol (DHCP) server. Since most networks have a DHCP server available, this method is applicable to most users and is the recommended method.

• **Preset configuration using DIP switch(es)** — The Network Controller card can be forced to use specific pre-defined network settings by means of DIP switches located on the card surface. This can be used to establish initial communications when no DHCP server is available, or to override a custom user configuration.

• **Custom user configuration via DashBoard** — Using the network setting options available in the DashBoard Control System, you may configure the Network Controller card to use a static address or enable DHCP for automatic configuration. This can only be done once communication has been established.

**Important** — Before proceeding, ensure that the DashBoard Control System software is installed on your computer.

Automatic Configuration using DHCP

This method assumes that the MFC-8300 Series Network Controller card is using the factory default values for the network settings.

**Note** — The MFC-8300 Series Network Controller card boots much faster than a typical DHCP server. In the case of a facility-wide power failure, the Network Controller card may not appear on the network if communications with the DHCP server cannot be established. Once the DHCP server becomes operational, re-boot the MFC-8300 Series Network Controller card to re-establish communications. To avoid this, you may use a static configuration as described in the section “Custom User Configuration via DashBoard” on page 2-6.

**To establish communications with the Network Controller card**

1. Ensure that openGear frame is connected to the same network as your DashBoard computer.
2. Launch the DashBoard application on your computer.
3. Power on the openGear frame that the Network Controller card is installed in.
4. Wait approximately 30 seconds while the frame establishes network communications.
5. Verify that the Network Controller card displays in the Tree View of DashBoard.
6. Should the card fail to display after two minutes:
   • Verify the ethernet cables are properly connected.
   • Check the link/activity LEDs found on the ethernet RJ-45 connectors.
   • Ensure the network settings for the Network Controller card are set to the factory default values.
   • If all cables are connected and the LEDs do not indicate an error, then automatic configuration is not possible. Proceed to the section “Preset Configuration using DIP Switches” on page 2-5.

Preset Configuration using DIP Switches

This method is used to establish initial communications when no DHCP server is available, or to override a custom user configuration and is intended to be used temporarily in order to establish communication. Once initial communications are established, the Network Controller card should be configured for either DHCP or Static operation.

**Note** — *Use of this method for normal operation is not recommended, as there is a high chance of IP Address conflicts.*

To use a preset network configuration using the DIP Switch(es)

1. Power down the openGear frame that houses the Network Controller card.
2. Quit DashBoard on your computer.
3. Set the DIP Switch to specify the preset IP Address as outlined in the applicable Setup chapter of this manual for your Network Controller card model.
4. Ensure the network settings of your computer are compatible with those chosen for the Network Controller card.

**Note** — *The IP Addresses of the Network Controller card and your computer must be similar, but not identical, and the Subnet Mask must match exactly the same. For example, if the Network Controller card has an IP Address of 192.168.2.1, then your computer should be configured for an IP Address with 192.168.2.X where X is a number other than 1.*

5. Before you begin, and to prevent IP Address conflicts, isolate the Network Controller card and your DashBoard computer from the rest of your network.
   • If you are using a hub or switch, unplug all devices except the Network Controller card and your DashBoard computer; or
   • Connect the openGear frame directly to the DashBoard computer.

**Note** — *The MFC-8310-N does not support Auto-MDIX, so a crossover cable may be needed for direct connection.*

*The MFC-8320-N supports Auto-MDIX, enabling you to use any ethernet cable when connecting the frame to the DashBoard computer.*

6. Launch DashBoard on your computer.
7. Power up the openGear frame.
8. Wait approximately 30 seconds while the frame establishes network communications.
9. Verify that the Network Controller card displays in the Tree View of DashBoard.
10. Should the card fail to display after a minute or two:
• Verify the ethernet cables are properly connected.
• Check the link/activity LEDs found on the ethernet RJ-45 connectors.
• Verify that you have properly performed each step of this procedure.
• Contact Ross Video Technical Support if you cannot establish a connection.

Custom User Configuration via DashBoard

Once communication has been established with the Network Controller card, the network settings may be further adjusted using the following procedure. Note that the steps are optional, you may perform as many, or as few, as needed.

Operating Tip — Some settings may require that you configure a DIP Switch before proceeding. Refer to the section “Card-edge Controls for the MFC-8320-S” on page 3-2, “Card-edge Controls for the MFC-8320-N” on page 4-2, or “Configuring the DIP Switches” on page 6-3 for configuration details.

To configure the network settings via DashBoard

1. In DashBoard, display the Device tab of the Network Controller card by double-clicking its status indicator in the Basic Tree View.
2. From the Device tab, select the Network tab.
3. To change the display name of the frame, enter a new name in the Frame Name field.
4. To change the Network Time Server address, enter the new IP Address in the NTP Server field.
5. To change between Static and DHCP addressing, select an option in the Addressing Mode area.
6. Configure the network settings as required:
   • IP Address — This is the IP Address of the Network Controller card.
   • Subnet Mask — This is the Subnet Mask address for your LAN.
   • Default Gateway — This is the IP Address for connection outside the subnet.
7. To save the new settings, click Apply in the Network tab. The settings are saved immediately and take effect except when overridden by DIP Switch settings. Clicking Cancel reverts to the previous settings.

User Rights Management

If your facility has installed and configured the DashBoard Server and URM feature, you may need to enter a URM user name and password to access the frame and any of the devices installed in the frame. For details on configuring and using the DashBoard Server and URM feature, refer to the DashBoard Server and URM User Manual.
Using a Master Password

Right-clicking an openGear frame node in the tree view of DashBoard provides the option to Lock/Unlock Access which requires the user to enter a Master Password before gaining access to the frame and the cards installed in it. This Master Password can be the same for all frames listed in the DashBoard client, or unique to each frame, or a mix.

When using the DashBoard Server and URM, openGear frame nodes in the Tree View display a lock icon to inform the user that restrictions are in place. This lock icon indicates that the node is locked and requires a Master Password, or that the user must log into the DashBoard client with a valid user account, to gain access to the node.

For More Information on...
- the lock icon, refer to the DashBoard Server and URM User Manual.

Before You Begin

Refer to Table 2.1 to verify that you are running the required DashBoard and card software versions. Note that at time of writing, the current version of DashBoard is 5.1.

<table>
<thead>
<tr>
<th>Card Model</th>
<th>DashBoard Version</th>
<th>Card Software Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>MFC-8320-S</td>
<td>4.0.0 or higher</td>
<td>1.10 or higher</td>
</tr>
<tr>
<td>MFC-8320-N</td>
<td>4.0.0 or higher</td>
<td>2.50 or higher</td>
</tr>
<tr>
<td>MFC-8310-N</td>
<td>4.0.0 or higher</td>
<td>2.50 or higher</td>
</tr>
</tbody>
</table>

Configuring the Master Password

Configuring the Master Password for your frame requires configuring the password feature in DashBoard.

Setting the DIP Switch

Your MFC-8300 Series Network Controller card includes a DIP Switch that enables you to override the Master Password.

- **MFC-8320-S** and **MFC-8320-N** — Use **SW3** to configure the Master Password.
- **MFC-8310-N** — Use **SW7** to configure the Master Password.

Use this DIP switch when the Master Password needs to be reset (e.g. when you have forgotten the password text). If you change the configuration of the DIP Switch, you must reboot the card before the changes take effect.

Override the Master Password using the DIP Switch as follows:

- **OFF** — This is the recommended position. A user-specified Master Password is used. The default password is password. It can be changed using DashBoard as outlined in the section “To configure the Master Password in DashBoard” on page 2-8.
- **ON** — This position is used to recover a lost Master Password. The user-specified password is temporarily ignored, and the default value of password is used.
To configure the Master Password in DashBoard

1. Navigate to the frame in the Tree View of the DashBoard client.
2. Right-click the frame node and select Lock/Unlock Access to display the Change Master Password dialog. By default, the current Master Password for the frame is automatically entered into the Old Password field.
3. Select the Change master password check box.
4. Type the new Master Password for the frame in the New Password field.
5. Re-type the new Master Password for the frame in the Confirm field.
6. Select the Prevent unauthorized access to this frame check box to enforce access controls for this frame.
   - Users with older version of DashBoard will be unable to connect to the frame.
   - DashBoard clients version 4.0.0 or higher will use DashBoard URM to determine user access rights.
7. From the dialog window located under the Confirm field, select the frame(s) you wish to apply the new Master Password to. Or you can use the provided menu to quickly select all frames, clear the selections, select only presently locked frames, or select only currently unlocked frames.
8. Click OK.

Accessing an MFC-8300 Series Network Controller Card

You can access an MFC-8300 Series Controller Card using your user account, assuming you have permissions to do so. If DashBoard URM is implemented in your facility and your DashBoard client is version 4.0.0 or higher, you log in as outlined in the procedure “To use a valid user account”. If DashBoard URM is unavailable, or when using the DashBoard Lite applet, you log in as outlined in the procedure “To use the Master Password”.

To use a valid user account

1. Launch the DashBoard client on your computer.
2. Log into the DashBoard client with your user account and password.

To use the Master Password

1. Launch the DashBoard client on your computer.
2. Navigate to a locked frame displayed in the Tree View of the DashBoard client.
3. Double-click the frame node to display the Password Required dialog. You can also double-click the frame name and select Open.
4. Enter the Master Password for the frame in the provided field.
5. Select one of the following methods:
   - Click Try Password to connect to the selected frame; or
• Click **Try for All** to connect to all locked frames displayed in the Tree View. Only when you attempt to connect to additional locked frames and the login fails, are you prompted for the password.

---

**Note** — Any frame accessed with a Master Password via the **Try for All** selection remains unlocked until you exit the DashBoard client.

6. If the password was incorrect, an error message displays to prompt you for another login attempt.
Enabling SNMP Support

Certain versions of the MFC-8300 Series Controller Cards provide optional support for remote monitoring and control of your frame and openGear cards using SNMP (Simple Network Management Protocol), which is compatible with many third-party monitoring and control tools. Refer to the section “Features” on page 1-2 for a list of cards that support SNMP.

Note — The MFC-8320-S does not support SNMP.

Enabling SNMP Support

The SNMP monitoring and control feature for your MFC-8300 Series Controller Card is a software option that is field upgradeable using DashBoard.

Note — If SNMP is enabled on an MFC-8320-N, it will perform as an MFC-8320-NS although DashBoard and SNMP still display MFC-8320-N. An MFC-8310-N with SNMP enabled will continue to display in DashBoard as MFC-8310-N as well.

To enable SNMP support using the SNMP tab in DashBoard

1. Ensure that you have configured the network settings for your card as outlined in the section “Network Configuration” on page 2-4.

2. In DashBoard, display the Device tab of the card by double-clicking its status indicator in the Basic Tree View.

3. From the Device tab, select the Setup tab.

4. In the Licensable Features area, make a note of the information displayed in the SNMP Request Code field.

5. Contact Ross Video Technical Support.
   • When you speak to the Technical Support representative, tell them your name, your facility name, and the SNMP Request Code displayed in the Setup tab.
   • You will be given a License Key that must be entered in the SNMP Feature Key field of the Setup tab.

6. Enter the License Key in the SNMP Feature Key field.

7. When the installation is complete, verify that the Setup tab displays “Licensed” in the SNMP Feature field and that the SNMP tab is now available in the Device View.

Configuring the SNMP Agent using DashBoard

The SNMP agent on the frame will accept SNMP GET and SET requests on the default SNMP port (161), using SNMP version 1 or SNMP version 2c. The SNMP Agent will send SNMP traps to one or more notification targets, with user-configurable address, port, and protocol version number.

To configure your SNMP Agent via DashBoard

1. In DashBoard, display the Device tab of the card by double-clicking its status indicator in the Basic Tree View.

2. From the Device tab, select the SNMP tab.
3. Set the required parameters as follows:
   - **Read Community String** — Enter the SNMP password for GET requests. For example, *public*.
   - **Write Community String** — Enter the SNMP password for SET requests. For example, *private*.

4. To add a trap/notification target, edit the **Trap/Notification Target** field. This field follows the format of `##.#.#.#/aaa;bb;cc` where:
   - `##.#.#.#` represents the **Target IP address** to which traps should be sent.
   - `aaa` represents the **UDP Port number** to which traps should be sent.
   - `bb` represents the **SNMP protocol version** to be used for traps to this target.
   - `cc` represents the **Target community string**.

   An example is provided in the **SNMP** tab in DashBoard.

5. Click **Add** to update the list with the new target.

6. Click **Apply** to apply your changes or **Cancel** to discard the changes. To remove a trap/notification target, select the target in the list, and click **Delete**.
Software Upgrades

The MFC-8300 Series Controller Card can be upgraded in the field from DashBoard (via TCP/IP). For MFC-8320-N software versions 2.20 and later, upgrades can also be done using the DashBoard Lite applet. Refer to the section “Uploading Software to a Card” on page 9-7 for details on using the DashBoard Lite applet.

Note — If you are using an MFC-8320-N, contact Ross Technical Support if you are upgrading from a software version of version 1.11 or lower. You must upgrade to version 1.12 before upgrading to a version higher than version 1.12.

To upgrade the software on a MFC-8300 Series Controller Card

2. In DashBoard, display the Device tab of the MFC-8300 Series Controller Card by double-clicking its status indicator in the Basic Tree View.
3. From the Device tab, click Upload to display the Select file for upload dialog.
4. Navigate to the *.bin upload file you want to upload to the MFC-8300 Series Controller Card.
5. Click Open to display a confirmation dialog.
6. If you are upgrading a single card, click Finish to display the Uploading to Selected Devices dialog. Proceed to step 8.
7. If you are upgrading multiple cards:
   • Click Next > to display the Select Destination menu. This menu provides a list of the compatible cards based on the card selected in step 2.
   • Specify the card(s) to upload the file to by selecting the check box(es) for the cards you wish to upload the file to.
   • Verify that the card(s) you wish to upload the file to. The Error/Warning fields indicate any errors, such as incompatible software or card type mismatch.
   • Click Finish to display the Uploading to Selected Devices dialog.
   • Proceed to step 8.
8. Monitor the upgrade.
   • The Uploading to Selected Devices dialog enables you to monitor the upgrade process.
   • Notice that each card is listed in the dialog with a button. This button is replaced with a Reboot button once the software file is loaded to that card.

Important — Avoid clicking the individual Reboot buttons until all cards have successfully completed the file upload process and the OK button, located in the bottom right corner of the dialog, is enabled.

• Click OK to reboot all the cards listed in the Uploading to Selected Devices dialog.
• The Reboot Confirm dialog displays, indicating the number of cards that will reboot. Click Yes to continue the upgrade process. Note that clicking Cancel or No returns you to the Uploading to Selected Devices dialog without rebooting the card(s).

Note — The communications processor of the MFC-8300 Series Controller Card requires approximately 30 seconds to re-start and re-establish network communications.
• The card(s) are temporarily taken offline during the reboot process. The process is complete once the status indicators for the Card State and Connection return to their previous status.

Troubleshooting

If you encounter problems when upgrading your card software, verify the following:

• Your network settings on the card are valid.
• The ethernet cable is properly connected if you are uploading the file via a network connection.
• The file you are attempting to load is a *.bin file that is for the card you are upgrading.
MFC-8320-S Setup

In This Chapter

This chapter provides information on setting up and using the card-edge controls of the MFC-8320-S Controller Card.

The following topics are discussed:

• Card-edge Controls for the MFC-8320-S
• Configuring the DIP Switches
• Monitoring the MFC-8320-S
Card-edge Controls for the MFC-8320-S

This section provides information on the jumpers, buttons and LEDs for the MFC-8320-S. Refer to Figure 3.1 for the location of card control features such as the Alarm Mute button, and the Alarm Config jumpers.

**Note** — The functionality of the MFC-8320-S depends on the openGear frame it is installed in. When installed in a DFR-8310 series frame, the MFC-8320-S does not provide an ethernet connection. When installed in a DFR-8321 series frame, the MFC-8320-S provides a single DashBoard connection.

1. **Alarm Mute Button**
   
The Alarm Mute button on the card-edge of the MFC-8320-S mutes the audio alarm for two minutes. If a fault condition is still present when the mute time-out ends, the card re-activates the audio alarm.

2. **Alarm Config Jumper**
   
The Alarm Config jumper enables or disables the audio alarm signal. The Alarm LED is still lit if alarm conditions are occurring, but the audio will be off. Refer to Figure 3.2 and the card labeling for jumper positions.

   ![Figure 3.2 Alarm Config Jumper — Pin Positions](image)

   • **Enabled** — To enable the alarm feature, set the jumper into Position 1+2.
   • **Disabled** — To disable the alarm feature, set the jumper into Position 2+3.

3. **DIP Switches**
   
   SW1 and SW2 are used in conjunction with the DashBoard menus to set the IP Address of the MFC-8320-S. Refer to the section “Configuring the DIP Switches” on page 3-3 for details.

   SW3 is used to override the Master Password for the MFC-8300 card. This password limits access to the card, and the cards installed in the frame.
Configuring the DIP Switches

This section briefly summarizes the DIP Switch settings on the MFC-8320-S. Figure 3.3 shows the DIP Switches in the ON position.

Figure 3.3 DIP Switches — Set to the ON Positions

SW1, SW2 — IP Address Setup

SW1 and SW2 are used in conjunction with the DashBoard menus to set the IP Address of the MFC-8320-S. Refer to Table 3.1 for DIP Switch positions. For information on configuring the network settings for your card, refer to the section “Network Configuration” on page 2-4.

Important — The settings related to ethernet setup only apply when using a DFR-8321 series frame. When installed in a DFR-8310 series frame, the ethernet port is not supported by the MFC-8320-S, and no communication with DashBoard is possible.

<table>

<td></td>
<td>The card IP Address is set to 10.1.2.1. The card Subnet Mask is set to 255.255.255.0.</td>
</tr>
</tbody>
</table>

Note — You must have DashBoard version 4.0.0 or higher, and MFC-8320-S software version 1.10 or higher.

SW3 — Master Password Override

SW3 is used to override the Master Password. This feature forces a reset of the Master Password. Refer to the section “Using a Master Password” on page 2-7 for details.

Note — You must have DashBoard version 4.0.0 or higher, and MFC-8320-S software version 1.10 or higher.

- OFF — This is the recommended position. A user-specified Master Password is used. The default password is password. It can be changed using DashBoard as outlined in the section “Using a Master Password” on page 2-7.
- ON — This position is used to recover a lost Master Password. The user-specified password is temporarily ignored, and the default value of password is used.
**SW4**

**SW4** is not implemented at this time and should be left in the \textit{OFF} position.
Monitoring the MFC-8320-S

The front card-edge of the MFC-8320-S, and the frame door, have LED indicators for the cooling module fan, alarm, and communication activity. Refer to Figure 3.4 for the location of the card-edge LEDs on the MFC-8320-S.

![Figure 3.4 MFC-8320-S Card-edge Controls](image)

Table 3.2 provides information on the LED displays of the MFC-8320-S.

</tbody>
</table>
In This Chapter

This chapter provides information on setting up and using the card-edge controls of the MFC-8320-N and MFC-8320-NS Controller Cards. The MFC-8320-N and MFC-8320-NS bring ethernet connectivity to the DFR-8300 series frames infrastructure, providing a DashBoard interface to monitor openGear cards in the frame. The MFC-8320-NS includes the SNMP Monitoring option.

The following topics are discussed:

- Card-edge Controls for the MFC-8320-N
- Configuring the DIP Switches
- Monitoring the MFC-8320-N
Card-edge Controls for the MFC-8320-N

This section provides information on the jumpers, buttons and LEDs for the MFC-8320-N and MFC-8320-NS. Refer to Figure 4.1 for the location of card control features such as the Alarm Mute button, and the Alarm Config jumpers.

![Figure 4.1 MFC-8320-N — Card Control Locations](image)

1. **Alarm Mute Button**

   The **Alarm Mute** button on the card-edge of the MFC-8320-N mutes the audio alarm for two minutes. If a fault condition is still present when the mute time-out ends, the card re-activates the audio alarm.

2. **Alarm Config Jumper**

   The **Alarm Config** jumper enables or disables the audio alarm signal. The Alarm LED is still lit if alarm conditions are occurring, but the audio will be off. Refer to Figure 4.2 and the card labeling for jumper positions.

![Figure 4.2 Alarm Config Jumper — Pin Positions](image)

- **Enabled** — To enable the alarm feature, set the jumper into Position 1+2.
- **Disabled** — To disable the alarm feature, set the jumper into Position 2+3.

3. **DIP Switches**

   **SW1** and **SW2** are used in conjunction with the DashBoard menus to set the IP Address of the MFC-8320-N. **SW3** is used to override the Master Password for the frame. Refer to the section “Configuring the DIP Switches” on page 4-3 for details.
Configuring the DIP Switches

This section briefly summarizes the DIP Switch settings on the MFC-8320-N. Refer to Figure 4.1 for their locations. Note that Figure 4.3 shows the DIP Switches in the ON position.

Figure 4.3 DIP Switches — Set to the ON Positions

SW1, SW2 — IP Address Setup

SW1 and SW2 are used in conjunction with the DashBoard menus to set the IP Address of the MFC-8320-N. Refer to Table 4.1 and the card labeling for DIP Switch positions. For more information on configuring the network settings for your card, refer to the section “Network Configuration” on page 2-4.

</tbody>
</table>

a. DHCP Mode is assumed until the user changes the settings in DashBoard.

SW3 — Master Password Override

SW3 is used to override the Master Password. The Master Password feature limits the MFC-8320-N to support only authenticated connections. Refer to the section “Using a Master Password” on page 2-7 for details.

Note — You must have DashBoard version 4.0.0 or higher with MFC-8320-N software version 2.50 or higher.

- **OFF** — This is the recommended position. A user-specified Master Password is used. The default password is *password*. It can be changed using DashBoard as outlined in the section “Using a Master Password” on page 2-7.
- **ON** — This position is used to recover a lost Master Password. The user-specified password is temporarily ignored, and the default value of *password* is used.

SW4

SW4 is not implemented at this time and should be left in the OFF position.
Monitoring the MFC-8320-N

The front card-edge of the MFC-8320-N, and the frame door, have LED indicators for the cooling module fan, alarm, and communication activity. (Figure 4.4)

![Figure 4.4 MFC-8320-N Card-edge Controls](image)

Table 4.2 provides information on the LED displays of the MFC-8320-N.

</tbody>
</table>
SNMP Monitoring on the MFC-8320-NS

The MFC-8320-NS provides optional support for remote monitoring and control of your frame and openGear cards using SNMP (Simple Network Management Protocol), which is compatible with many third-party monitoring and control tools. You must obtain a license key from Ross Video to enable SNMP support.

For More Information on...

- enabling and configuring the SNMP Agent for your MFC-8320-NS, refer to the section “Enabling SNMP Support” on page 2-10.
MFC-8310 Setup

In This Chapter

This chapter provides information on using the MFC-8310 Controller Card. The MFC-8310 enables you to monitor the fans, power supply status, and the cards installed in the DFR-8300 series frames.

The following topics are discussed:

- Controls for the MFC-8310
Controls for the MFC-8310

This section provides information on the jumpers, buttons, and LEDs for the MFC-8310. Refer to Figure 5.1 for the location of the LEDs and controls for fan, alarm, and communications.

![Figure 5.1 MFC-8310 Card-edge Controls](image)

Buttons and Jumpers on the MFC-8310

This section briefly summarizes the available buttons and jumpers on the MFC-8310.

**Alarm Mute/Bootload Button**

If a card is reporting an error, pressing the **Alarm Mute** button mutes the audio alarm until another fault condition occurs. This button is also used as a **Bootload** button for factory service in the unlikely event of a complete card failure.

**Alarm Configuration Jumper**

The Alarm Configuration Jumper enables or disables the audio alarm signal. The Alarm LED is still lit if alarm conditions are occurring, but the audio will be off.
Monitoring the MFC-8310

In the DFR-8310 series frames, the CFM-8310 (Cooling Fan Module) provides LED and Alarm switching controls to the front-edge of the DFR-8310 frame door. Refer to the *DFR-8300 and OG3-FR Series User Manual* for details on these LEDs. Table 5.1 provides information on the LED displays of the MFC-8310.

**Table 5.1  MFC-8310 LED Descriptions**

MFC-8310-N Series Setup

In This Chapter

This chapter provides instructions for setting up the MFC-8310-N and MFC-8310-NS Network Controller Cards. The MFC-8310-N brings ethernet connectivity to the DFR-8300 series frame infrastructure, providing a DashBoard interface to monitor openGear cards in the frame. The MFC-8310-NS includes the SNMP Monitoring option.

The following topics are discussed:

• Controls for the MFC-8310-N Series
• Configuring the DIP Switches
• Monitoring the MFC-8310-N
Controls for the MFC-8310-N Series

This section provides information on the jumpers, buttons and LEDs for the MFC-8310-N series. Refer to Figure 6.1 for the location of the controls for fan, alarm, and communications.

![Figure 6.1 MFC-8310-N Series DIP Switches and Card-edge Buttons](image)

1. **Alarm Mute Button**
   
   When a card in the frame is reporting an error, pressing the Alarm Mute button will mute the audio alarm until another fault condition occurs. This button is also used as a Bootload button for factory service in the unlikely event of a complete card failure.

2. **Reset Button**
   
   This button is used to restart both of the on-board processors: the fan control processor and the communications processor. The communications processor requires approximately 30 seconds to restart and re-establish network communications.

3. **DIP Switches**
   
   The DIP Switches provide card-edge controls for configuring the Audio alarm and specifying an IP address for the card. Refer to the section “Configuring the DIP Switches” on page 6-3 for details.
Configuring the DIP Switches

This section briefly summarizes the DIP Switch settings on the MFC-8310-N. Refer to Figure 6.1 for the location of the DIP Switches. Note that Figure 6.3 shows the DIP Switches in the ON position.

---

**Note** — You must remove the MFC-8310-N from the frame, or remove the adjacent cards, to access the DIP Switches.

---

**Figure 6.2 DIP Switches — Set to the ON Positions**

SW1 — Audio Alarm Setup

SW1 configures the Audio Alarm Disable feature as follows:

- **ON** — This setting activates the feature. Alarms will not be audible.
- **OFF** — This setting de-activates the feature. Alarms will be audible.

SW2 to SW6

SW2 to SW6 are not implemented at this time and should be left in the OFF positions.

---

SW7 — Master Password Override

SW7 is used to override the Master Password. The Master Password feature limits the MFC-8310-N to support only authenticated connections. Refer to the section “Using a Master Password” on page 2-7 for details.

---

**Note** — You must have DashBoard version 4.0.0 or higher with MFC-8310-N software version 2.50 or higher.

- **OFF** — This is the recommended position. A user-specified Master Password is used. The default password is **password**. It can be changed using DashBoard as outlined in the section “Using a Master Password” on page 2-7.
- **ON** — This position is used to recover a lost Master Password. The user-specified password is temporarily ignored, and the default value of **password** is used.
SW8 — IP Address Setup

SW8 enables you to select the IP Address of the MFC-8310-N as described in Table 6.1. For more information on configuring the network settings for your card, refer to the section “Network Configuration” on page 2-4.

a. DHCP Mode is assumed until the user changes the settings in DashBoard.
Monitoring the MFC-8310-N

The front-edge of the MFC-8310-N, and the frame door, have LED indicators for the cooling module fan, alarm, and communication activity. (Figure 6.3)

Table 6.2 provides information on the LED displays of the MFC-8310-N.

**Table 6.2 MFC-8310-N Series LED Descriptions**

Enabling SNMP Monitoring on the MFC-8310-NS

The MFC-8310-NS provides optional support for remote monitoring and control of your frame and openGear cards using SNMP (Simple Network Management Protocol), which is compatible with many third-party monitoring and control tools. You must obtain a license key from Ross Video to enable SNMP support.

For More Information on...

- enabling and configuring the SNMP Agent for your card, refer to the section “Enabling SNMP Support” on page 2-10.
DataSafe

In This Chapter

DataSafe enables you to load and store card parameters automatically, or you can load from and store to a single file in DashBoard. This feature is available for frames using the MFC-8320-N, and MFC-8310-NS cards only. For more information on using the DataSafe feature in DashBoard, refer to your DashBoard Control System User Manual.

Note — DashBoard version 2.3.0 or higher is required to access DataSafe features.

This chapter contains the following sections:

- Overview
- DataSafe and Network Controller Cards
Overview

The following DataSafe features are available when using a MFC-8300 Series Network Controller Card:

- The Network Controller card monitors all traffic going through it. On power-up, the Network Controller card queries for all card information.
- Changes to writable parameters of cards is noted and the current version of all parameters is stored. Parameter data is stored locally on the network card for every slot independently.
- Parameter data can be saved in a single file.
- DataSafe enables the user to send all the parameter data to a card slot or to every slot on the network that matches.
- You can use a limited DashBoard view to update a subset of cards instead of the entire connected view. DashBoard sends the file to a specific network card and slot for use. Once received, it updates the card if the attached card matches the data sent.
- DataSafe stores and recalls the parameters automatically with or without a network connection.
- When a DataSafe mismatch occurs, there is an audible alarm from the card and a warning message is displayed in DashBoard. You can clear the alarm using an option in the Setup tab, or by using the card-edge controls. A DataSafe mismatch occurs when the software version or the card type does not match the saved data for that slot.
- Note that DataSafe is disabled by default.

For More Information on...

- the options available in the DataSafe tab, refer to the section “DataSafe Tab” on page 8-9.
- enabling DataSafe for your Network Controller card, refer to the section “Enabling DataSafe” on page 7-3.
DataSafe and Network Controller Cards

This section briefly summarizes the DataSafe options available for the MFC-8300 Series Network Controller Card.

Using the Alarm Button

An audible alarm indicates when a DataSafe mismatch occurs, such as when a card is installed that does not match the compatibility range of the DataSafe saved data.

- Single pressing the Alarm button mutes the audible alarm, but does not mask the alarm displayed in DashBoard. For information on masking DataSafe mismatch warnings, refer to the section “Hiding the DataSafe Warnings” on page 7-4.
- Holding the Alarm Mute button on the MFC-8300 Series card down for approximately 5 seconds causes the new settings of all cards to be copied to the saved DataSafe slots.

Enabling DataSafe

All slot fields in the DataSafe tab of your Network Controller Card are set to Disable by default. The Disable feature prevents DashBoard from automatically recalling the card parameters for the specified slot. You may still monitor the status of the cards in those slots, and DashBoard still updates the slot information when a new card is installed or when a card is removed from the slot and replaced with another card.

To enable DataSafe for a specific slot

1. From the Tree View in DashBoard, double-click the Network Controller Card to display a corresponding Device Tab in the Device View.
2. Select the DataSafe tab.
3. Locate the card slot(s) you wish to enable DataSafe for.
4. Clear the corresponding checkbox in the Disable column.

Re-naming a Card Slot

DashBoard enables you to re-name a card slot and have that name display in all Tree Views and the DataSafe tab window for the specific Network Controller Card.

To re-name an openGear slot in the Tree View

1. From the Tree View in DashBoard, double-click the Network Controller Card to display a corresponding Device Tab in the Device View.
2. Select the Setup tab.
3. In the Card Slot Names section of the Setup tab, locate the slot you wish to re-name.
4. Enter the new name for the card slot in the text field provided.
Hiding the DataSafe Warnings

A DataSafe mismatch warning occurs in DashBoard when:

- a card of the same type is installed that does not match the software of the card previously installed in that slot; or
- a card of a different type is installed in the slot.

DashBoard includes a **Mask Warning** option in the **DataSafe** tab for each Network Controller Card. Enabling the Mask Warning option prevents error messages from displaying in the **Data Safe State** field of the **Hardware** tab.

**To hide DataSafe mismatch warnings in DashBoard**

1. From the **Tree View** in DashBoard, double-click the Network Controller Card to display a corresponding **Device Tab** in the **Device View**.
2. Select the **DataSafe** tab.
3. Mask the DataSafe mismatch warnings as follows:
   - **Checkbox cleared** — DashBoard displays an error message in the **Data Safe State** field of the **Hardware** tab. Information is also displayed in the **Conflict** field of the **DataSafe** tab to alert the user that a software mismatch is occurring. This is the default setting.
   - **Checkbox selected** — This feature is disabled. DashBoard does not update the **Data Safe State** field of the **Hardware** tab, nor the **Conflict** field of the **DataSafe** tab.

Forcing DataSafe Files to Load

The **Conflict** field in the **DataSafe** tab indicates when a currently installed card has a card type or software incompatibility.

- When there is a DataSafe mismatch on the slot, the **Update Slot** button is enabled for that slot. Click this button to replace the last saved parameters with the current card parameters.
- Use the **Force** button in the **DataSafe** tab to force the currently saved DataSafe data to load to all cards with software mismatches and store the new information. Refer to the **DashBoard Control System User Manual** for details.

Resetting a Network Controller Card to Factory Defaults

Through DashBoard, you can reset the factory settings of the Network Controller Card using the **Restore** button in the **Setup** tab. Note that the frame name is unaffected.

**Important** — Clicking the **Restore** button erases all DataSafe data for the Network Controller Card.

Clicking the **Restore** button in the **Setup** tab of the Network Controller card performs the following tasks in DashBoard:

- All values in the **Setup** tab of the Network Controller card are reset to the factory defaults.
- All Slot names are deleted. Slot name fields are blank and all DashBoard fields are updated with the default names.
DashBoard Menus

In This Chapter

This chapter provides information the DashBoard menus available for the MFC-8300 Series Controller Cards. Note that some of the available menus and options are dependent on the card you are using. Default values are indicated with an asterisk (*).

The DashBoard Control System enables you to monitor and control openGear frames and cards from a computer. DashBoard communicates with other cards in the DFR-8300 series frame through the MFC-8300 Series Controller Cards. You can download the DashBoard software and manual from the Ross Video website.

The following topics are discussed:

- Status Tabs
- Setup Tab
- Network Tab
- DataSafe Tab
- SNMP Tab
Status Tabs

This section summarizes the Status tabs displayed in DashBoard for the MFC-8300 Series Controller Cards. The indicators in the Status tabs can vary in severity from green (valid), yellow (caution), to red (alarm). DashBoard reports the most severe alarm for a single field. Alarm colors are noted within the tables as text set in brackets next to the parameter name.

Product Tab

Table 8.1 summarizes the read-only information displayed in the Product tab.

</tr>
</tbody>
</table>

Notes on the Trap/Notification Target Feature

Keep the following in mind when adding and saving Trap/Notification targets in the SNMP tab:

- When entering a new target in the Trap/Notification Target field, type the text in the field, and then press Enter to enable the Add button.
- Click Add to add the new target to the Trap/Notification Target drop-down list.
- A maximum number of six strings are displayed in the Trap/Notification Target drop-down list at one time. If at the maximum number, you must select a string from the drop-down list and delete it before adding a new entry.
- Click Apply to save the strings in the Trap/Notification Target drop-down list to non-volatile memory.
DashBoard Lite Applet

In This Chapter

If you are using an MFC-8320-N or MFC-8310-N Network Controller Card running software version 2.25 or higher, you can access the DashBoard Lite applet using a web browser. However, if your facility also has the DashBoard Server and URM installed, you will need version 2.50 or higher. The DashBoard Lite applet enables you to make card adjustments through a web browser interface instead of installing the DashBoard Control System software on your computer.

This chapter provides information on installing, accessing, and using the DashBoard Lite applet.

The following topics are discussed:

• Before You Begin
• DashBoard Lite Applet Overview
• Adding Frames to the DashBoard Lite Applet
• Using the DashBoard Lite Applet
• Uploading Software to a Card
• Troubleshooting
Before You Begin

Refer to the following sections before using the DashBoard Lite applet.

System Requirements

Ensure that your system meets the following requirements before using the DashBoard Lite applet.

- MFC-8310-N or MFC-8320-N software version 2.25 or higher.
- If your facility also has the DashBoard Server and URM installed, you will need MFC-8320-N software version 2.50 or higher. Refer to the section “Software Upgrades” on page 2-12 for details on upgrading the software for your card.
- Computer running the Microsoft® Windows® XP®, Windows Vista®, or Windows 7® operating systems
- Firefox® 3 or higher or Microsoft® Internet Explorer® 7 or 8
- Java® 6 update 11 or higher
- Ensure that the Java 6 plug-in is properly configured for your web browser

To run the DashBoard Lite Applet

1. Make a note of the IP address for the frame you are attempting to access.
2. Launch your web browser from your computer desktop.
3. Enter the frame IP address into the Address Bar of your web browser.
4. Press Enter to display the openGear Frame Configuration web page.
5. Click the DashBoard Lite icon to start the DashBoard Lite applet.
6. Wait while DashBoard Lite verifies the version of Java installed on your computer. Once your version of Java is verified, the DashBoard Lite applet opens in the web browser.
DashBoard Lite Applet Overview

When first launched, the DashBoard Lite applet connects to and displays the specific frame you entered the IP Address for, and the devices installed in that frame. The interface resembles the DashBoard interface but does not support:

- the restoring of card settings from a file
- the porting of card settings from one card to another
- the upgrading of multiple cards at one time
- DashBoard Server and URM management access controls. Only global access to the frame (via the Master Password) is supported.

Interface Overview

This section includes a brief summary of the Dashboard Lite applet interface and its components.

![Figure 9.1 DashBoard Lite Applet Interface Example](image)

1. **Navigation Pane**

The DashBoard Lite applet displays the following details in the **Navigation Pane**:

- An indicator for each frame. If you entered a new name using the *Add Frames* dialog, it is displayed beside the indicator. The indicator beside the frame is the worst-case status of all cards in the frame.
- The product name for each card installed in the frame and which slot it is in. The name for each card is the product name as reported by the card.
- Indicators for each card in the frame. The cards and their status are detected automatically.

2. **Status Area**

This area is located in the tabbed menu on the lower left of the screen. This area displays the status parameters as reported by the card including the **Product** tab. The **Product** tab displays the
product name, alarm status, details about the most serious alarm reported, and the connection status. The information in the **Status** Area is read-only.

### 3. Arrow Buttons

The Arrow buttons are located at the top of the vertical bar that separates the **Status** Area and the **Settings** Area within the **Device View**. Click the arrows to maximize or minimize the Status and Settings Areas in the direction of that arrow.

For example, with all areas maximized, click the top arrow to maximize the **Settings** Area within the **Device View**. Click the bottom arrow to return the areas of the Device View to the default size. Click the bottom arrow again to maximize the **Settings** Area within the **Device View**.

### 4. Settings Area

This area is located in the tabbed menu on the right side of the screen, and is used to configure the parameters for the card. Each parameter has an appropriate control for configuring that parameter. The following features may be available:

- a drop-down box of selections;
- a slider for limited-range variables; or
- an entry field with arrows for continuous variables.

### 5. Button Area

The following buttons are available at the bottom of the **Device View**:

- **Add Frame** button — Use this button to display a new frame in the **Navigation Pane**.
- **Refresh** button — Use this button to request the latest information from the card.
- **Upload** button — Use this button to upload new software to the card.
- **Reboot** button — Use this button to instruct the card to reboot.
- **Close** button — Use this button to close the specific **Device** tab.

## Device View

You can select a device from the **Navigation Pane** to display its tab in the **Device View**. Selecting a Device tab enables you to view the information on that device such as product information, monitoring options, and editable parameters.

Each Device tab is labeled with the name of the frame, the slot number that the device is installed in, the device type, and the status indicator. You can have several Device tabs open at any time in the Device View such as displayed in **Figure 9.1**.
Adding Frames to the DashBoard Lite Applet

Once the DashBoard Lite applet is running, you can select additional openGear frames to communicate with. This section outlines the connection methods for adding frames.

There are two connection methods for adding a frame:

- **Automatic Detection** — DashBoard Lite applet performs network discovery and presents a list of frames detected on your network. Select a frame from the list to connect to it. It is recommended to select this method if the IP Address of your frame may change. This is the default method.

- **Advanced Connection** — Advanced Connection allows you to enter the IP Address of the device. You can also select this connection if the openGear frame you want to add is not listed in the Automatic dialog.

To add frames to the DashBoard Lite applet

1. Ensure the DashBoard Lite applet is running on your computer.
2. Click Add Frame located at the bottom of the Navigation Pane to display the Add Frame dialog. The Automatic tab is selected by default in the Add Frame dialog.
3. To add a frame using an Automatic Detection:
   - Select the desired frame name. You can also select more than one frame at a time.
   - Click OK to add the selected frame and exit the dialog. Or click Cancel to exit the dialog and not save any changes.

4. To add a frame using an Advanced Connection:
   - Select the Advanced tab from the Add Frame dialog.
   - Enter a name for the frame in the Frame name field.
   - Enter the IP Address of the frame in the IP Address field.
   - Enter the port of the frame in the Port field.
   - Click OK to save your changes and exit the dialog. Or click Cancel to exit the dialog and not save any changes.

---

Operating Tip — Click Refresh to update the list of Detected Frames in the Automatic tab. The refresh feature causes the DashBoard Lite applet to check the network for recently added or enabled frames.
Using the DashBoard Lite Applet

This section provides a brief summary of how to access the DashBoard Lite applet.

Password Protected Frames

A frame that is locked is represented as a node with a lock symbol in the Tree View. If you double-click a locked frame, the Master Password prompt displays and you must enter the current password before accessing the frame and the cards installed in it. From this prompt you can also change the password and specify access to the frame as outlined in the section “Configuring the Master Password” on page 2-7.

Note — The MFC-8320-N or MFC-8310-N must be running software version 2.50 or higher.

To change and verify device information for the MFC-8320-N

1. From the Navigation Pane, double-click a card indicator to display a new tab in the Device View.

2. Change the parameters using the controls provided in the Settings area.
   - The parameters available in the Settings area depends on the card you have selected to configure.

3. To close a tab so that it is no longer displayed in the Device View:
   - Right-click the tab.
   - Select close to close the selected tab. You can also click Close in the selected tab.
   - Select close all to close all card tabs.
Uploading Software to a Card

Use the following procedure to upload software to a card:

1. Select the Device tab in the Device View for the device you wish to upload software to.
2. In the Device tab, select Upload to display the File Upload dialog. Note that the Upload button is disabled when the Read Only check box is selected.
3. Navigate to the directory where the upload file is stored, and select the file to be sent.
4. From the File Selection dialog, click Open. The DashBoard Lite applet reads the file and displays a Confirmation dialog. This dialog displays the selected upload file name, type, size, and the file creation date.
5. From the Confirmation dialog, you can select from the following:
   • Click Cancel to cancel the upload of the file and return to the Device View.

   Important — Do not click Cancel unless the upload progress has stopped completely for 60 seconds or more. Canceling an upload may leave the card in an invalid state.

   • Click Continue to upload the file. While uploading, the Uploading Progress dialog is displayed.

6. When the upload process is complete:
   • The card reboots and may be briefly offline. However, some cards will prompt for confirmation before rebooting.
   • The Product tab indicates the new software information in the required fields.
Troubleshooting

This section provides additional information should you encounter problems with running or using the options in the DashBoard Lite applet.

Starting the DashBoard Lite Applet

This section provides additional information to help troubleshoot problems you may encounter when using the DashBoard Lite applet.

- **An error dialog displays stating that Java® is disabled** — Refer to your web browser help system for information on enabling Java.

- **An error dialog displays stating that the wrong version of Java is installed** — You must upgrade your Java version to Java 6 update 11 or higher. A link to the Java website is provided in the error dialog.

- **An error dialog displays stating that Java is not installed on your computer** — You must install Java 6 update 11 or higher on your computer. A link to the Java website is provided in the error dialog.

- **A Warning - Security dialog displays** — This dialog states that the application digital signature cannot be verified and prompting you to run the application. To continue loading the DashBoard Lite applet, click Run.

Device Tab Issues

If you are unable to make changes to the parameters of a card, or the Upload or Reboot buttons are disabled:

1. Verify that your system view is not set to Read Only as follows:
   - Right-click the System View option.
   - Clear the Read Only check box.

2. Verify that the Edit Permission for the card is set to Unlocked in the Device tab. This control typically appears on the Setup page of the Device tab.

Frame Connections

This section provides a troubleshooting list if your frame is not automatically detected by the DashBoard Lite applet when you attempt to add a frame.

1. Verify that the frame is powered on and connected to the network by navigating to the frame IP Address using your web browser.

2. Contact your IT Department to learn if the selected frame is operating inside a firewall which can cause the Automatic Connection to fail.

3. Click Refresh in the Add frames dialog and verify if the frame is listed.

4. If the frame is still not listed, you must re-connect to the frame using the Advanced Connection method as outlined in the section “To add frames to the DashBoard Lite applet” on page 9-5.
Troubleshooting the Software Upload Process

This section provides information to troubleshoot when the software upload process has failed.

Power or Communications Loss

If the power or communications is lost during the upload process, there will be no response from the card. It is recommended to perform the following:

1. Verify the card is powered on.
2. Verify communications by re-starting the upload process.
3. If the upload process continuously fails, re-boot the card and re-start the upload process again. Note that this step is only recommended when other methods have failed.

Messages in the Upload Failed Dialog

You may receive a message in the Upload failed dialog that indicates the reason for the failure.

- **Selected file does not exist** — Click OK and re-start the upload process.
- **Selected file is not a valid upload file** — Verify the filename is correct. Click OK to re-start the upload process.
- **Selected file is rejected by the card** — Verify that you are uploading the software to the correct card. For example, you will receive this message when attempting to upload FSR-6601 software to a SRA-8601A card.
- **No response from device** — The upload failed while in progress due to a loss of power or communications. Refer to the section “Power or Communications Loss”. This can also be caused by congestion on the internal frame communication bus. To isolate this problem, other cards in the frame can be temporarily removed for the duration of the upgrade.
- **Recovering from a failed upload** — Note that the following is only recommended when other methods have failed. To recover from a failed upload:
  - Re-boot the card by clicking Reboot in the Device tab;
  - Wait for the card to boot up; then,
  - Re-start the file upload process.
Service Information

In This Chapter

This chapter contains the following sections:

• Troubleshooting Checklist
• Warranty and Repair Policy
Troubleshooting Checklist

Routine maintenance to this openGear product is not required. In the event of problems with your MFC-8300 Series Controller Card, the following basic troubleshooting checklist may help identify the source of the problem. If the card still does not appear to be working properly after checking all possible causes, please contact your openGear products distributor, or the Technical Support department at the numbers listed under the “Contact Us” section.

1. **Visual Review** — Performing a quick visual check may reveal many problems, such as connectors not properly seated or loose cables. Check the card, the frame, and any associated peripheral equipment for signs of trouble.

2. **Power Check** — Check the power indicator LED on the distribution frame front panel for the presence of power. If the power LED is not illuminated, verify that the power cable is connected to a power source and that power is available at the power main. Confirm that the power supplies are fully seated in their slots. If the power LED is still not illuminated, replace the power supply with one that is verified to work.

3. **Input Signal Status** — Verify that source equipment is operating correctly and that a valid signal is being supplied.

4. **Output Signal Path** — Verify that destination equipment is operating correctly and receiving a valid signal.

5. **Card Exchange** — Exchanging a suspect card with a card that is known to be working correctly is an efficient method for localizing problems to individual cards.

**MFC-8320-S Alarm Mute/Bootload Button**

In the unlikely event of a complete card failure, you may be instructed by a Ross Technical Support specialist to perform a complete software reload on the MFC-8320-S. The **Alarm Mute/Bootload** button enables emergency booting in case of flash corruption or, to recover from a failed software upgrade.

The MFC-8320-S contain a primary software load and two backup loads. When the **Alarm Mute/Bootload** button is pressed and held during power-up, the card will try the two backups, in turn, instead of the primary load. If a valid backup is found, it is copied into the primary load. If neither backup is valid, then all LEDs are lit to indicate a failure.

When running from a backup copy that differs from the primary load, the **Frame Status** indicator in the Hardware tab of DashBoard displays “Running a backup code”. If this message displays, Ross Video recommends performing a software upgrade to ensure that all copies remain valid.

**MFC-8320-N and MFC-8310-N Bootload Buttons**

The **Bootload** function is not implemented on the MFC-8320-N and MFC-8310-N Network Controller Cards. However, these cards may be recoverable via their web interface as follows:

1. If the IP address of the card is known, use a web browser to try and connect to the frame by typing the IP address into the browser window as http://xxx where xxx represents the frame IP address.

2. If this is successful, this provides access to diagnostic information for troubleshooting. Contact Ross Technical Support for assistance.
Warranty and Repair Policy

The MFC-8300 Series Controller Card is warranted to be free of any defect with respect to performance, quality, reliability, and workmanship for a period of FIVE (5) years from the date of shipment from our factory. In the event that your MFC-8300 Series Controller Card proves to be defective in any way during this warranty period, Ross Video Limited reserves the right to repair or replace this piece of equipment with a unit of equal or superior performance characteristics.

Should you find that this MFC-8300 Series Controller Card has failed after your warranty period has expired, we will repair your defective product should suitable replacement components be available. You, the owner, will bear any labor and/or part costs incurred in the repair or refurbishment of said equipment beyond the FIVE (5) year warranty period.

In no event shall Ross Video Limited be liable for direct, indirect, special, incidental, or consequential damages (including loss of profits) incurred by the use of this product. Implied warranties are expressly limited to the duration of this warranty.

This MFC-8300 Series Controller Card User Manual provides all pertinent information for the safe installation and operation of your openGear Product. Ross Video policy dictates that all repairs to the MFC-8300 Series Controller Card are to be conducted only by an authorized Ross Video Limited factory representative. Therefore, any unauthorized attempt to repair this product, by anyone other than an authorized Ross Video Limited factory representative, will automatically void the warranty. Please contact Ross Video Technical Support for more information.

In Case of Problems

Should any problem arise with your MFC-8300 Series Controller Card, please contact the Ross Video Technical Support Department. (Contact information is supplied at the end of this publication.)

A Return Material Authorization number (RMA) will be issued to you, as well as specific shipping instructions, should you wish our factory to repair your MFC-8300 Series Controller Card. If required, a temporary replacement frame will be made available at a nominal charge. Any shipping costs incurred will be the responsibility of you, the customer. All products shipped to you from Ross Video Limited will be shipped collect.

The Ross Video Technical Support Department will continue to provide advice on any product manufactured by Ross Video Limited, beyond the warranty period without charge, for the life of the equipment.
